Jhoose Security Modules v2.5.0 — Import/Export, .NET 9 Support and More

We're excited to announce the release of **Jhoose Security Modules v2.5.0**, introducing powerful new tools to simplify configuration management and enhance your Optimizely project's security setup.

What's New

Import and Export Functionality

You can now easily **import and export** your Jhoose Security settings, including **CSP configurations** and **security headers**.

This feature makes it much simpler to:

1. Move security configurations between development, staging, and production environments.
2. Maintain consistent policies across multiple Optimizely sites.
3. Back up and restore configurations quickly when deploying updates.

.NET 9 Compatibility

Version 2.5.0 adds support for **.NET 9**, ensuring your security tooling remains compatible with the latest platform enhancements and long-term support updates.

Bug Fixes and Refinements

This release also includes several **bug fixes** and general improvements aimed at stability and developer experience.

Upgrading

To upgrade, simply update your NuGet package to the latest version:

```
1  dotnet add package Jhoose.Security --version 2.5.0.349
```

After upgrading, review your existing configuration to confirm all settings have migrated as expected.

Why It Matters

Managing CSPs and headers consistently across environments has always been a challenge — this update significantly streamlines that process, giving development teams greater control and confidence when deploying secure Optimizely environments.
